

macOS, local

`./setup.sh`
installs deps, creates a venv outside the repo

build S4

optional – pinned fork/commit, live optics only

`source .../activate`
use python, not python3

`radcoolpv run case.yaml`
persistent install

Google Colab, hosted

open the notebook badge
no local Python or S4 needed

Runtime → Run all

cell installs radcoolpv

optional S4 build runs in the Colab VM

edit YAML, run again
temporary session – repeat after reset

one YAML case

optics

thermal
